

ReviewLoop Architecture Overview

Read-only capture • Durable artifacts • Agent-readable comments

1. Capture pipeline

When a review is published the CLI reads the source repository or document but never writes to it. The bytes are AES-256-GCM encrypted into an opaque token, and an optional short link id is stored in a local SQLite database. The browser decrypts nothing — the server resolves the token and streams the rendered artifact.

2. Supported artifact types

Type	Renderer	Annotation
Code diff	server-side unified diff	line anchors
Markdown	markdown-it	line anchors
Image	native 	paintbrush
PDF	pdfjs-dist	paintbrush per page
Word	docx-preview	text selection
PowerPoint	@aiden0z/pptx-renderer	paintbrush per slide
Excel	SheetJS xlsx	cell selection + paintbrush

3. Comment lifecycle

1. Human opens the snapshot URL in a browser.
2. Human anchors a comment to a line, region, cell, or slide.
3. Comment is persisted once in the shared comment store.
4. Server posts open comments to the configured Gateway endpoint.
5. Agent revises and publishes a new snapshot version.

This second page exists so the PDF live-review multi-page navigation and the page-scoped paintbrush annotations both have something to exercise during manual acceptance testing.
